Wk

Lecture review: Introduced <u>Data Flow Diagrams</u> (model.4) as a primary means to perform system design. You can quickly map data to potential application features by working with the key data fields. In this example, we used the HorseShow diagram and five features a horse rider would need at a horse show and used color to map the data by feature. Some designers start thinking about "what is nice to have" or theoretical. But, if you get right to work on what you can make happen, you can reduce aggravation and drive conversations with customers on what is essential.
